

Her device is her voice, *at home too.*

You don't have to be a therapist. You just have to talk with it, and keep it close.

The one thing that matters most: talk while touching the words on her device. Not as a lesson, not as a quiz, just as part of talking. A child hears a language for about a year before their first word, and her device deserves that same fair start. Every time you model, you show her how her voice works.

Start with these words

You don't need the whole device. A handful of **core words** do most of the talking. Touch them as you say them, all day:

go

all done

help

want

like

not

different

look

Do this

Model, then wait. Touch one or two words, say them, then pause and count a silent ten.

Keep it close. Out, on, and in reach at dinner, in the car, at the park. It can't be her voice in a backpack.

Honor every try. A tap, a look, a gesture, a word. Respond like she meant it.

Skip this

Don't quiz. No "what's this?" or "show me." Quizzing turns her voice into a test.

Don't take it away. Never as a punishment. Her voice isn't a privilege to remove.

Don't move or shrink it. Same words, same spots. Changes go through her team so her hand keeps finding her words.

She's exploring the buttons — is that okay?

Yes. That's babbling, and it's exactly how every child learns a new language. Keep modeling alongside her. The real conversations grow right out of that exploration.

Five seconds, every setting. Before you leave the house or start an activity, check: **V**isible, **O**n, **I**n reach, **C**harged, **E**very setting. A device in the backpack is a voice that can't ask for anything.
